Wohlgemuth J,

' system for leukocyte expression profiling, diagnosing a disease, or intoring (the rate of) progression of a disease, e.g. atherosclerosis congestive heart failure, comprises diagnostic oligonucleotides. .. [24 Altman P, , Johnson Ė nuth J, Fry K, Matcuk G, Woodward R, Quertermous I WPI; 2002-636525/68. monitoring ς Σ Nev

Phillips J;

Prentice J,

Claim 1; Page 330; Opp; English

The invention relates to a system for detecting gene expression, which

```
ö
comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for predicting therapeutic outcome, determining prognosis for a patient, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for predicting disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kindny allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17; leukocyte; gene expression profiling; allograft rejection;
atherosclerosis; congestive heart failure; systemic lupus erythematosus;
rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prentice J, Phillips J;

This invention relates to novel methods for diagnosing and monitoring autoimmune and chronic inflammatory diseases. Specifically, it refers to the identification of genes that have a clinical utility as diagnostic tools for the management of, in particular, patients with systemic lupus erythematosis (SLE) or rheumatoid arthritis (RA). Accordingly, the present invention describes a method for determining the levels of multiple differentially expressed genes of a patient, in a concerted manner, in order to achieve an improved diagnostic assay with sensitivity and specificity for the disease in question. As such, these genes are useful for the diagnosis of various other inflammatory disorders including cholecystitis, sjogren's disease, CREST syndrome, sclerosing ankylosing spondylitis, ulcerative colitis, primary sclerosing ankylosing spondylitis, ulcerative colitis, primary sclerosing cholangitis, appendicitis, diverticulitis, and primary biliary sclerosis. This oligonucleotide is a human DNA probe used to monitor the expression.
                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing or monitoring autoimmune and chronic inflammatory diseases, each as rheumatoid arthritis, systemic lupus erythematosus, ulcerative colitis, psoriasis and asthma by detecting the expression level of one or more genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human DNA probe used to monitor expression of diagnostic genes SeqID761.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human; ss; autoimmune; chronic inflammatory disease; SLE; systemic lupus erythematosis; rheumatoid arthritis; cholecystitis; Sjogran; s disease; CRST syndrome; scleroderma; ankylosing spondylitis; ulcerative colitis; primary sclerosing cholangitis; appendicitis; diverticulitis; primary biliary sclerosis; probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. nechanical organ replacement rejection, an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoria arthritis, lungus, inflammatory bowel diseases, multiple sclerosis, HIVAIDS or viral, bacterial or fungal infection. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ral, bacterial or fungal infection. The present sequence represents a mer oligonucleotide marker for diagnosis and monitoring of allograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Morris M;

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antibody to human CD40, or its functional dendritic cells to produce IL-12 in the presence of LB8 dendritic cells to produce IL-12 in the presence of LB8 (lipopolysaccharide) and IFNgamma (interferon gamma); acting on dendritic cells to activate maturity of the dendritic cells with high G28-5 antibody; and activating CD95 expression with high G28-5 antibody against B cell line. Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies for autoimmune diseases, allergy or coagulation factor VIII inhibitors syndrome. This polymucleotide sequence represents an oligo relating to

Tumour necrosis factor (TNF) receptor has an important role in the regulation of cellular proliferation, differentiation, and apoptosis in inflammatory and immune responses. The present invention relates to a quantitative assay for measuring the ability of a substance to effect binding of a TNF receptor-associated factor (TRAF) protein to its receptor. CD40 is a TRAF2 receptor. The present sequence is a PCR primer used to amplify amino acids 216 to 277 of human CD40 cytoplasmic domain (CD40c). Peptide antagoniers of CD40c-TRAF2 binding were identified by the present invention (AAB07004 to AAB07010)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ds; immunosuppressive; antiinflammatory; antiallergic; cardiovascular-Gen; antimicrobial; virucide; antibacterial; antimatic; orfusatelic; dermatological; antipacialic; antithematic; orfusatelic; dermatological; antiasthmatic; antidiabetic; antiateriosclerotic; neuroprotective; antiasthmatic; antidiabetic; antiateriosclerotic; neuroprotective; espiratory-Gen; gastrointestinal-Gen; gene therapy; human; CD40 receptor; organ transplant rejection; inflammation; lymphocyte co-stimulation; allergy; autoimmune disorder; cardiovascular disorder; rheumatoid state; cancer; allergic dermatitis; psoriasis; arteriosclerosis; multiple sclerosis; pulmonary fibrosis, asthma; diabetes; Lyme disease; crohn's disease; ulcerative colitis; luques; thyroiditis; arthritis; leukemia; lymphoma; neurodegenerative disease; small interfering RNA; siRNA; gene expression; gene silencing.
                                                                                                                                                                                                                                                                                       Quantitative assay for measuring the effect of a substance on tumor necrosis factor receptor associated factor protein interaction with it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2.7%; Score 27.4; DB 3; Length 41; 96.6%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primers under suitable conditions to enzymatically generate sub-population of labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs where the method comprises producing subpopulation of labeled NAs for the different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, comprising the population, where the comparison is preferably differences in the population, where the comparison is preferably comprising the population, where the comparison is preferably difference in the population, where the comparison is preferably comprising the patterns for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal cypression analysis of diseased a normal tissue e.g. neoplastic a normal tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCK primer used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specific pct of the printed specification, but was obtained in electronic format directly from USPTO at http.wipo.seqdata.uspto.gov/sequence.html?PDCID=635282981
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, TRAP protein, Tumour-necrosis factor, TNF, CD40, PCR primer, 88,
TNF receptor-associated factor, cell proliferation, cell differentiation,
apoptosis, inflammation, immune response, receptor-ligand binding assay.
                                                                                                                                                                                                                                                                                                                                   Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                   New oligoribonucleotides specific for the human CD40 receptor, useful for treating e.g. transplant rejection, inflammation and autoimmune diseases, also related duplexes and gene transfer vectors.
                                                                                                                                                                                        The invention relates to oligoribonucleotide (ONI) homologous with the 241-259 region of the CDNA (I) that encodes the human CD40 receptor, published as GenBank X60592. ONI, also their subsequences and derived duplaxes (all optionally chemically modified), are useful for treatment of rejection of transplanted organs or tissues; acute and chronic inflammation; processes that involve co-stimulation of lymphocytes; allergic, autoimmune or cardiovascular disorders; infections; rheumatoid arteriosclerosis; multiple sclerosis; pulmonary fibrosis; viral and bacterial infection; asthma; type I diabetes; Lyme and Crohn diseases; ulcerative colitis; lupus; thyroiditis; arthritis; leukemia and lymphoma;
                                                                                                                                                                                                                                                                                                                        also neurodegenerative diseases. This sequence corresponds to one of the small interfering RNA (siRNA) molecules used as an example of the oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           se; binding domain; cell-surface molecule; tumour necrosis factor; TNF ligand family; TRAIL; TNF receptor superfamily; cytostatic; antiinflammatory; immunosuppressive; antirhemmatic; antiarthritic; neuroprotective; antidabetic; protozoacide; virucide; antibacterial; antiallergic; signalling cascade; apoptosis; immunomodulation; cancer; metabolic disease; multiple sclerosis; diabetes mellitus;

This invention describes a novel polypeptide which comprises a segment that contains a binding domain for a cell-surface molecule; a peptide that contains a binding domain for a cell-surface molecule; a peptide corrosis factor (TNF) ligand (TRAIL) family that, alone, is inactive or necrosis factor (TNF) ligand (TRAIL) family that, alone, is inactive or merrosis factor (TNF) ligand (TRAIL) family that, alone, is inactive or immunoglobulin and the TRAIL fragment becomes fully active only after binding domain to a cell-surface molecule. The TNF ligand (Tragment is the extracellular domain (or its functional variants or fragments) of a TNF family ligand, especially TRAIL, Fas, TNF, 41BBL, CC fragments of a TNF family ligand, especially TRAIL, Fas, TNF, 41BBL, CC fragments of a TNF family ligand, especially TRAIL, Fas, TNF, 41BBL, CC a growth factor, e.g. epidermal growth factor, or an amagiogent, caperifically where the ligand is a peptide or protein hormone (especially, cc or growth factor, e.g. epidermal growth factor, or an amagiogent, cegeptor superfamily, e.g. TNF, R2, CD30, CD40 or CD28, for a membrane-cc of the binding domain is derived from a receptor, especially of the TNF cc of the ligand from which TNF ligand segment is derived. The products of the invention have cytostatic, antiinflammatory, immunosuppressive, antichabetic, antiarthritic, neuroprotective, antidiabetic, of the invention have cytostatic, antiinflammatory immunosuppressive, antidiabetic, cof the invention, also nucleic acid constructs, varied and colleic acid constructs, varied and colleic acid constructs, varied and expenses them, are useful for treatment of cancers (solid or lymphatic cumours), metabolic diseases, inflammation and autoimmune diseases, cransplant rejection. The policet of the invention, also nucleic acid constructs, and autoimmune diseases, particularly rheumatic/arthritic diseases, also multiple sclerosis, callabetes mellitus, protozoal, bacterial and viral infections and cells transplant rejection. The policet of the tr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                         New fusion polypeptide, useful for treating e.g. cancer, infections and inflammation, comprises binding domain for cell-surface molecule and fragment of tumor necrosis factor ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; binding domain; cell-surface molecule; tumour necrosis factor; TNF ligand family; TRAIL; TNF receptor superfamily; cytostatic; antiinflammatory; immunosuppressive; antirhemmatic; antiarthritic; neuroprotective; antidiabetic; protozoacide; virucide; antibacterial; antiallergic; signalling cascade; apoptosis; immunomodulation; cancer; metabolic disease; multiple sclerosis; diabetes mellitus;

Human; TRAF protein; Tumour-necrosis factor; TNF; CD40; PCR primer; ss; TNF receptor-associated factor; cell proliferation; cell differentiation; apoptosis; inflammation; immune response; receptor-ligand binding assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour necrosis factor (TNF) receptor has an important role in the regulation of cellular proliferation, differentiation, and apoptosis in inflammatory and immune responses. The present invention relates to a quantitative assay for measuring the ability of a substance to effect binding of a TNF receptor-associated factor (TRAF) protein to its receptor. CD40 is a TRAF2 receptor. The present sequence is a PCR primer used to amplify amino acids 216 to 277 of human CD40 cytoplasmic domain (CD40c). Peptide antagonists of CD40c-TRAF2 binding were identified by the present invention (AAB07004 to AAB07010)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Quantitative assay for measuring the effect of a substance on tumor necrosis factor receptor associated factor protein interaction with it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 37 BP; 12 A; 12 C; 11 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel polypeptide which comprises a segment to that contains a binding domain for a cell-surface molecule; a peptide colline and segment that contains a fragment of a member of the tumour necrosis factor (TNF) ligand (TRAIL) family that, alone, is inactive or necrosis factor (TNF) ligand (TRAIL) family that, alone, is inactive or immunoglobulin and the TRAIL fragment becomes fully active only after immunoglobulin and the TRAIL fragment becomes fully active only after immunoglobulin and the TRAIL fragment becomes fully active only after frament is the extracellular domain (or its functional variants or fragments) of a TNF family ligand, especially TRAIL Fas, TNF, 418BL, CH40L, CD30L or Ox40L. The binding domain binds to a membrane-bound receptor, specifically where the ligand, especially TRAIL. Fas, TNF, 418BL, CH40L, CD30L or Ox40L. The binding domain bar or cytokine. Alternatively, a special script a growth factor, or a nangiogenic agent, a growth factor, e.g. epidermal growth factor, or an angiogenic agent, a growth factor, e.g. epidermal growth factor, or an angiogenic agent, or usecular endothelial growth factor) or a cytokine. Alternatively, the binding domain is derived from a receptor, or an angiogenic agent, or of the ligand from which TNF ligand segment is derived. The products of of the ligand from which TNF ligand segment is derived. The product of antibacterial and antiallergic activity.

CC of the invention have cytostatic, antiinflammatory, immunosuppressive, antirheamatic, antiatricial and antiallergic activity.

CC Activation of signalling cascades through TNF family receptors of signalling cascades through TNF family receptors.

CC of the invention, also nucleic acid constructs, vectors and cells that especially induction of signalling cascades through TNF family ligand is developed in cannens), metabolic diseases, inflammation and auticimmune diseases, particularly theumatic/arthritic diseases, also multiple solerois, carangeled, tisbace- or cell-special and anner, s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                               The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. mechanical organ replacement rejection, kenotransplant rejection or mechanical organ replacement rejection, in an individual. The methods are also useful in diagnosing and monitoring an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonocleotide marker for diagnosis and monitoring of
                                                                                       Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

```
the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of the compounds to a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding cof the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAX52701 to AAX52706, represent sequences used in the exemplification of the present invention

                                                                                                                                                                            expression of human CD40. Which can be used to inhibit the expression of human CD40. Which can be used to inhibit the expression of human CD40. Ed40. Which can be used to inhibit the expression of human CD40. CD40 is involved in lymphocyte activation, prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically disease or psoriasis) or hyperproliferation (specifically disease or psoriasis) or hyperproliferation (specifically disease or psoriasis) or hyperproliferation (specifically cancer and tumours). the antisense oilgonucleotides are also useful as diagnostic and research reagents. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to AAZ47775 represent other PCR primers and a probe used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass
Antisense molecules directed against nucleic acid encoding human CD40, for treating e.g. immune, inflammatory or hyperproliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Control in the invention relates to selecting a target molecule that has an altinity concises introducing a target molecule into a test mixture of the ligand cand a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand and a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand also included are a method of detecting a ligand-target complex laying an affinity as expressed as a dissociation constant of nanomolar. Industry as expressed as a dissociation constant of nanomolar laying an affinity as expressed as a dissociation constant of nanomolar can least two molecules determining the relative interaction between a first target molecule with the relative proximity of binding sites for a first target molecule when a second target molecule with respect to a ligand, a method for screening the binding the relative concent to a ligand, a method for modulating the binding affinity of a first target molecule for a ligand, a method for modulating the binding a structure of an oligomer, a method for modulating the binding a structure of an oligomer, an enthod for determining the relative of an oligomer, and though a method of determining the relative oriented by the first ligand, a method of determining the relative compound secondary structure, a method of determining the relative compound econdary structure of an oligomer, and a second binding site for a second binding site for a second binding site for a second binding ligand on a target contribute an uncleotide sequence that corresponds to a portion of the computation and a second binding site for a second binding transcription in a cell, a method of determining to a target substrate, an oligomeric compound comparises a nucleotide sequence that corresponds to a portion of a precursor RM, and a microRM, a method of modulating transcription in a cell, a method of compound second in a set of (oligomeric)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               interfering RNA) and antisense oligonucleotides. The method is useful for determining the mode of binding interaction between two or more target molecules to the ligand as well as their relative affinities. The oligomeric compounds are useful in drug discovery and target validation,
                    The invention relates to selecting a target molecule that has an affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) probe for human CD40 mRNA used to assess expression of CD40 during treatment with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention describes a novel antigen-presenting, preferably subcellular, vesicle comprising molecules on its surface for first, and preferably second, signals for antigen-specific activation of T lymphocytes or a first signal for antigen-specific anergiation of such colls or for induction of negative-regulatory T cells. The vesicles of the invention have cytostatic and immunostimulant activity and are used in vaccines, particularly where the HLA and peptide components are matched to a particularly where the HLA and peptide components are second antigen against which T cells are to be activated, or are from a lalergen or autoantigen against which anergy is required. Particularly the vesicles are used to treat, or screen, tunmours, to induce an immune component or aveals antigen, for analysis of new costimulatory, adhesion or other molecules, for controlled release of messengers and/or growth contrivalent binding reagents, e.g. for antigen-specific characterisation of animals. This sequence represents a primer used to controlled and as a plactform for preparing multivalent binding reagents a primer used to controlled and a plactform for preparing multivalent binding reagents a primer used to controlled a primer used to controlled and a plactform for preparing the processing and a plactform for preparing the processing and a plactform for preparing and a place of the controlled and a place of the controlled and a place of the control of an antigen specific characterisation and controlled and a place of the control of an antigen and control of a place of the control of a place of the control of an antigen and control of a place of the control of an antigen and control of a place of the control of an antigen and control of the control of an antigen and control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The patent discloses fusion protein comprising human osteoprotegerin (OPG) protein fused by linker to human 1gG1 Fc portion. OPG negatively regulates formation of osteoclasts in vitro and in vivo. It blocks the differentiation of osteoclasts from monocyte or macrophage precursors and the reabsorption of bone. The OPG-Fc fusion protein are administered for the treatment of bone loss resulting from osteoporosis, Paget's disease, osteomyellits, hypercalcaemia, osteopenia associated with surgery or steroid administration, osteomerosis, bone loss due to rheumatoid arthritis, periodontal bone loss, osteolytic metastasis and/or prosthetic lossening. The present DNA sequence is 1467-05 oligonucleotide which is used to generate human met-Fc (lacking 1-5 residues)-OPG (22-194
                                                                                                                                                                                                        Osteoprotegerin-Fc protein fusions useful for treating bone loss caused by e.g. osteoporosis, Paget's disease and osteomyelitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CD40 transmembrane domain; CD40 cytoplasmic domain; CD40; CD40t/c; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying members of specific binding pairs in cell expressing first binding pair member (FBM) fused to apoptosis inhibitor by identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to a method for identifying members of specific binding pairs. The method comprises providing a cell which is susceptible to apoptosis, expressing in the cell a first binding pair member (FBM) fused to apoptosis inhibitor, exposing the cell to an apoptosis inducing agent and contacting the cell with a second binding pair member (SBM), where members of specific binding pairs are identified by binding of FBM to SBM, such that apoptosis inhibitor is activated to inhibit apoptosis. The method is useful for screening human cDNA libraries for traget antigens e.g., tumour epitopses. Preferably, the FBM are expressed as fusion proteins with the signalling portion (the transmembrane and cytoplasmic) of CD40 (CD40L/c). The present sequence is

```

The present invention relates to a method for identifying members of specific binding pairs. The method comprises providing a cell which is susceptible to apoptosis, expressing in the cell a first binding pair member (FBM) tused to apoptosis inhibitor, exposing the cell to an apoptosis inducing agent and contacting the cell with a second binding pair member (SBM), where members of specific binding pairs are identified by binding of FBM to SBM, such that apoptosis inhibitor is activated to inhibit apoptosis. The method is useful for screening human cDNA

```
Conserved in the human, mouse and bovine CD40 genes. A fusion protein conserved in the human, mouse and bovine CD40 genes. A fusion protein consisting of the extracellular domain of human CD154 coupled to mouse Ig kappa light chain was able to bind to portine CD40, indicating that direct signalling between a porcine graft and the immune cells of a human cost is possible through this molecular pathway. CD40-deficient donor mammal cells, tissues or organs may be used for xenografting in order to ameliorate cellular graft rejection in the recipient mammal. In carcilar, porcine cells, tissues or organs are genetically modified so that the cell surface expression of CD40 antigen is reduced. Transgenic pigs may have an inactivated CD40 antigen gene and a transgene, e.g. human Decay Accelerating Factor (HDAF) gene. The CD40-deficient donor mammal cells, tissues or organs may be used as transplants have a charact in humans or other mammals (claimed). The transplants have a ceduced immunogenicity because the CD40 antigen gene is inactivated
                                                                                                                                                                           ö
libraries for target antigens e.g., tumour epitopes. Preferably, the FBM are expressed as fusion proteins with the signalling portion (the transmembrane and cytoplasmic) of CBQ (CD40L/C). The present sequence is a PCR primer used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating cellular graft rejection in a recipient mammal using CD40-deficient donor mammal cells, tissues or organs as a xenograft, comprises inactivation of the CD40 antigen gene with a targeting vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CD40 antigen; xenograft; CD40-deficient donor; graft rejection;

(1) are used to prevent or treat cardiovascular complications such as restenosis after angioplasty or stenois by-passes, chronic or acute transplant rejection and graft versus host disease, immunological hypersensitivity, e.g. bronchial asthma or atopic dermatitis, inflammatory diseases such as ulcerative colitis, psoriasis and Crobn's disease and autoimmune diseases such as diabetes mellitus, multiple sclerosis, collagenosis (e.g. systemic lupus erythematosus), rheumatoid arthritis and vasculitis. (1) simultaneously weaken both Thl and Th2 responses. The present sequence is that of a PCR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to substantially pure CD40 splice variant proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents a PCR primer for amplifying CD40 splice variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This introduction describes moved using immunosuppressive, antiallargic, neuroprotective, immunosuppressive, antiallargic, neuroprotective, immunosuppressive, antiallargic, antiallargic, immunosuppressive, antiallargic, antialpaetic, inducible of atea in their promoters include those for CP40, E-electin, inducible of after introduction and invention may lift inhibition of gene capression where this is blocked by transcription factors, e.g. the gene conception and new antisense oligonucleotides, are used to treat or prevent cardiovascular complications, interferon-gamma. The decy oligonucleotide and new antisense oligonucleotides, are used to treat or prevent cardiovascular complications, especially restreonic after percutaneous angioplasty and stenosis in venous by-passes.

Confuries of surgery, immunological hypersensitivity reactions (types I-CV), autoimmune diseases (sepecially diabetes mellitus, multiple sclerosis and rheumatory diseases, sepecially of the jointe (architits), respiratory corgans (bronchial asthma and chronic bronchitis), skin (psoriasis and neurodermatitis) or gastrointestinal tract (ulcerative colities or Crohn's diseases). Appressing the decy oligonucleotides

The invention relates to treating a kidney disease and involves transplanting a graft of human nephric tissue at a differentiation stage corresponding to 4-10 weeks of gestation or transplanting a graft of porcine nephric tissue at a differentiation stage corresponding to 3-6 weeks of gestation. The method is used for treating kidney disease and for evaluating transplant suitability. The kidney disease and for evaluating transplant suitability. The kidney disease includes acute kidney failure, acute nephritic syndrome, analgesic nephropathy, anterembolic renal disease, chronic kidney failure, chronic nephritis, anteresticial nephritis, kidney cancer, kidney damee, Goodpasture's syndrome, 1gM mesangial proliferative glomerulonephritis, interstitial nephritis, kidney cancer, kidney dames of kidney infection, kidney injury, kidney stones, lupus nephritis, mebranoproliferative glomerulonephritis, nephroblastema, nephroalentosis, nephrogenic diabetes insipidus, 1gA-mediated nephrogathy, nephrosis, nephrogenic diabetes insipidus, 1gA-mediated nephropathy, nephrosis, renal acidosis type I, renal tubular acidosis type I, renal tubular acidosis type I, thrombosis, Sequences ACC00575-76 represent PCR primers for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating kidney disease e.g. chronic nephritis comprises transplanting human or porcine nephric tissue graft transplantation at differentiation stage corresponding to specific period of gestation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kidney disease, transplantation, nephric tissue, nephrotropic, cytostatic, litholytic, antidiabetic, thrombolytic, CD40, PCR, primer;

The invention describes double-stranded (ds) DNA oligonucleotides (I) in which one strand (Ia) has any of 26 sequences (some degenerate), given in the specification, and the other strand is complementary to (Ia). Also described are the use of (a) ds oligonucleotides (II) that bind to the transcription factor AP-1 or (b) ds oligonucleotides (III) having any of a specified sequences (these include (I)) for preparing a composition for treatment or prevention of (i) acute or chronic transplant rejection and graft-versus-host disease or (ii) ischaemic/reperfusion injury to crans during surgery. (I), and other known ds oligonucleotides that bind to the transcription factor AP-1, are used to treat or prevent (i) acute or chronic transplant rejection and graft-versus-host disease or (ii) confour transplant rejection and graft-versus-host disease or (ii) acute or chronic transplant rejection in cells, especially endothelial and antigen-presenting cells, e.g. by ex vivo treatment of donor organs before transplantation. (I) become active immediately after entering a cell, i.e. more quickly than antisense or interfering oligonucleotides. This sequence represents a reverse transcription PCR primer used in the isolation of human CD4U, used in an assay to determine the effect of ds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New double-stranded oligonucleotides that bind specifically to the AP-1 transcription factor, useful for treating e.g. transplant rejection or ischemic/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The present invention describes a method for treating a disorder associated with pathological organ or tissue physiology or morphology. The method comprises transplanting into a subject a therapeutically effective mammalian organ or tissue graft, where the organ or tissue capable of stimulating by the subject, and so treating the disorder in the subject, also described: Subject, and so treating the disorder in the subject, Also described: Caulating the suitable for transplantation of a mammalian organ or tissue most suitable for transplantation of the organ or tissue into a mammalian subject. The method is useful in treating a disorder a subject; with pathological organ or tissue physiology or morphology, e.g., kidney, pancreatic, hepatic, metabolic, cardiac, haematological and/or genetic disorder; where the pancreatic disorder is especially diabetes. The presents a PCR primer used for the amplification of the colly. Capable from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating organ or tissue disorders comprises transplanting into a subject a human or porcine organ or tissue at a stage of differentiation corresponding to 5-16 weeks (human) or 20-63 days (porcine) of gestation.
                                                                                                                                                                        organ disorder; tissue disorder; organ physiology disorder; organ morphology disorder; tissue physiology disorder; tissue graft; tissue graft; tissue graft; tissue graft; tissue graft; tissue graft; immune response; antianaemic; antidiabetic; cardiant; hepatotropic; immunosuppressive; nephrotropic; cell therapy; kidney disorder; pancreatic disorder; hepatic disorder; metabolic disorder; cardiac disorder; hematological disorder; genetic disorder; pcrimer; ss; human; renal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2.4%; Score 24; DB 13; Length 24; 100.0%; Pred. Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAD. The binding of the MAD to the CD40 antigen is located on the surface of human B cell. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections. Antibodies to membrane-associated antigens - used for treating transplant rejection, graft-versus-host disease, antibody-mediated disease and auto-
                                                                                                                                                                                                                                                                                    Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the
                                                                                                                                                                                                                                                                                                human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAb. The binding of the MAb to the CD40 antigen is located on the surface of human B cell. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymerase chain reaction; PCR; primer; amplify; B7; B-cell; T-cell; baculovirus vector; hybridoma; antibody; antigen; immunosuppressor; interleukin-2; IL-2; transplant_rejection; graft vs host disease; GVHD;

The sequences represented by AAQ96201-Q96204 are used in the invention.
The sequences represented by AAQ96197 and AAQ96198 are primers for the
This sequence is also used (along with AAQ96200) as a
Cull length B7-1. This sequence corresponds to bases 307-324 of
the full length B7-3. This sequence corresponds to bases 307-324 of
the full length B7-3. This sequence corresponds to bases 307-324 of
that is expressed on activated B-cells, and is a ligand for the CD28
creceptor of T-cells. There are three ligands of B7-1 (B7-1, B7-2, and B7-
3). The sequence amplified by these primers is inserted into a
baculovirus vector and used for the production of B7-1 specific
antibodies using hybridoma techniques. The anti-B7-1 antibodies can then
be included in a composition containing an immunosuppressive agent that
inhibits the production of interleukin-2 (IL-2) by T-cells. This
composition can be administered to patients and thereby used to prevent
transplant rejection, and to treat graft vs host disease (GVHD) and
creumatoid arthritis. The advantage with using this composition is that
it induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences represented by AAQ96201-Q96204 are used in the invention. The sequences represented by AAQ96197 and AAQ96198 are primers for the full length B7-1. This sequence is also used (along with AAQ96200) as a primer for soluble B7-1. This sequence corresponds to bases 307-224 of the full length B7 gene. B7 is a monomeric transmembrane glycoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymerase chain reaction; PCR; primer; amplify; B7; B-cell; T-cell; baculovirus vector; hybridoma; antibody; antigen; immunosuppressor; interleukin-2; IL-2; transplant rejection; graft vs host disease; GVHD; rheumatoid arthritis; therapy; CD28; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ဌ

The present sequence represent a PCR primer used in an example of the present invention. The particularly immunoglobulin B (IgB) mediated diseases, particularly immunoglobulin B (IgB) mediated allergies, systemic lupus erythematosus, primary biliary cirrhosis, idiopathic thrombocytopaenia purpura and rheumatoid arthritis. The MAb inhibits the normal B cell response to CD40 ligands at relatively low concentrations and is unlikely
that is expressed on activated B-cells, and is a ligand for the CD28 receptor of T-cells. There are three ligands of B7 (B7-1, B7-2, and B7-3). The sequence amplified by these primares is inserted into a baculovirus vector and used for the production of B7-1 specific antibodies using hybridoma techniques. The anti-B7-1 antibodies can then be included in a composition containing an immunosuppressive agent that inhibits the production of interleukin-2 (IL-2) by T-cells. This composition of interleukin-2 (IL-2) by T-cells. This transplant rejection, and to treat graft ws host disease (GVHD) and rheumatoid arthritis. The advantage with using this composition is that it induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; B7 antigen; CD40; PCR primer; monoclonal antibody; B cell; growth;
differentiation; allergy; autoimmune disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A novel humanised monoclonal antibody (MAb) has been developed which: (binds a human CD40 antigen on the surface of a B cell, to prevent its growth and differentiation; and (b) has an effective number of exposed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         binds a human CD40 antigen on the surface of a B cell, to prevent its growth and differentiation; and (b) has an effective number of exposed amino acids in its framework regions that are consistent with amino acid residues found in the corresponding framework regions of a human Ab to provide a reduced immunogenicity in humans. The present sequence represent a PCR primer used in an example of the present invention. The particularly immunoglobulin E (IgB) mediated allergies, systemic lupus erythematosus, primary biliary cirrhosis, idiopathic thrombocytopaenia purpura and rheumatoid arthritis. The MAb inhibits the normal B cell response to CD40 ligands at relatively low concentrations and is unlikely concentrations and is unlikely
                                                                                                                                                                                                                                                                                   Human, B7 antigen, CD40, PCR primer, monoclonal antibody, B cell; growth,
differentiation, allergy, autoimmune disease; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel humanised monoclonal antibody (MAb) has been developed which: (a)

The sequences represented by AAQ96201-Q96204 are used in the invention.

The sequences represented by AAQ96197 and AAQ96198 are primers for the full length BP-1. This sequence is also used (along with AAQ96200) as a primer for soluble BP-1. This sequence corresponds to bases 307-324 of the full length B7 gene. B7 is a monomeric transmembrane glycoprotein that is expressed on activated B-cells, and is a ligand for the CD28 ceceptor of T-cells. There are three ligands of B7-1, B7-2, and B7-3). The sequence amplified by these primers is inserted into a baculovirus vector and used for the production of B7-1 specific antibodies using hybridoma techniques. The anti-B7-1 antibodies can then be included in a composition containing an immunosuppressive agent that inhibits the production of interleukin-2 (IL-2) by T-cells. This composition can be administered to patients and thereby used to prevent transplant rejection, and to treat graft vs host disease (GVHD) and rheumatoid arthritis. The advantage with using this composition is that it induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, B7 antigen, CD40, PCR primer, monoclonal antibody, B cell, growth,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAb. The binding of the MAb to the CD40 antigen is located on the surface of a human B cell. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibodies to membrane-associated antigens - used for treating transplant rejection, graft-versus-host disease, antibody-mediated disease and auto-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymerase chain reaction; PCR; primer, amplify; B7; B-cell; T-cell; baculovirus vector; hybridoma; antibody; antigen; immunosuppressor; interleukin-2; IL-2; transplant rejection; graft vs host disease; GVHD;

A novel humanised monoclonal antibody (MAb) has been developed which: (a) binds a human CD40 antigen on the surface of a B cell, to prevent its growth and differentiation; and (b) has an effective number of exposed amino acids in its framework regions that are consistent with amino acid residues found in the corresponding framework regions of a human Ab to provide a reduced immunogenicity in humans. The present sequence represent a PCR primer used in an example of the present sequence MAb can be used to prevent or treat antibody mediated diseases.

Mab can be used to prevent or treat antibody mediated diseases, errithematosus, primary biliary cirrhosis, idiopathic thrombocytopaenia purpura and rheumatoid arthritis. The MAb inhibits the normal B cell response to CD40 ligands at relatively low concentrations and is unlikely
                                                Humanised monoclonal antibody binding CD40 antigen on B cells - to prevent their growth and differentiation, useful to treat or prevent antibody mediated allergies and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 34 BP; 4 A; 12 C; 12 G; 6 T; 0 U; 0 Other;

New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.

Example 14; SEQ ID NO 135; 177pp; English.

The invention relates to a novel chimeric or human monoclonal antibody or

```
its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates sytostatic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody-related PCR primer of the invention.

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 10; Page 84; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a LNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual oNS with the tNA sequence comprising the tNA according to defined criteria; and evaluating in silico the binding of the virtual oNS with the tNA according to defined criteria; and (2) a method of defining a set

```
of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gethered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAY52701 to AAY52706, represent sequences used in the exemplification of the present invention

CD40 is involved in lymphocyte activation, tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically asthma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) or hyperproliferation (specifically cancer and rumours). The antisense of ligonoclectides are also useful as diagnostic and research reagents. AAZ47775 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47771 to AAZ47775 represent other PCR primers and a probe used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; CD40; antisense oligonucleotide; phosphorothioate; modulation; expression; immune disease; inflammatory disease; immunomodulatory; anti-inflammatory; anti-arthritic; anti-asthmatic; antiproliferative; anticancer; immuno-suppressive; anti-psoriaritic; allograft rejection; hyperproliferative disease; autoimmune disease; rheumatoid arthritis; inflammatory bowel disease; asthma; psoriasis; cancer; tumour; PCR primer; ss.

The invention discloses a method for increasing the expression of costimulatory molecules, such as CD40, and major histocompatibility complex (MHC) class I and class II antigens in tumour cells in vitro. The method comprises contacting the tumour cells with deacetylase inhibitor (DAI). Tumourogenesis is related, in part, to the failure of the immune system to reject spontaneously arising tumours by responding system to reject spontaneously arising tumours by responding considered to be a critical initial step and T cell activation requires an antigen specific signal, which involves the antigenic peptide and the CONSIGNES IN The increased expression of these molecules increases the immunogenicity of tumours and their susceptibility to lysis. The inhibitors of deacetylation, at low concentrations, produce little or no apoptosis and maintain a normal cell cycle. The expression considerance and cell lysis on cells is induced. The DAIs are preferably trichostatin A (TSA) or sodium butyrate. The sequence presented is a real time PCR probe used to detect expression levels of the human CD40 gene
                                                                                                                                                                                                                                                                  Human; ss; PCR; probe; real-time PCR; costimulatory molecule; CD40; major histocompatibility complex; MHC; class I; class II; antigen; tumour; deacetylase inhibitor; DAI; tumourogenesis; immune system; I lymphocyte; I cell activation; immunogenicity; antigen presentation; cell lysis; trichostatin A; TSA; sodium butyrate; cytostatic; CD40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

```
CC of an oligomer, a method for identifying a ligand that alters a target compound secondary structure, a method of determining the relative change in proximity of binding sites for a first ligand, a method of determining target substrate influenced by the first ligand, a method of determining the relative change in proximity of a first binding site for a binding to a second binding site for a second binding ligand on a target, a method of determining the relative orientation of a first ligand to a second ligand when bound to a target substrate, an oligomeric compound comprises a mucleotide sequence at least 80% complementary to a target CRNA (where the oligomeric compound comprises a nucleotide sequence that corresponds to a portion of the comprises a nucleotide sequence that corresponds to a portion of the comprises a nucleotide sequence that corresponds to a portion of the complementary to a target oligomeric compound that comprises a stemloop structure), a method of modulating translation in a cell, a method of modulating translation in a cell, a method of of a precursor RNA into a microRNA in a cell, a method of of a target nucleic acid molecule, a computer formatted medium comprising conversion of a precursor RNA into a microRNA in a cell, a method of generating a set of (oligomeric) compounds that modulate the expression of a target nucleic acid molecule, a computer formatted medium comprising computer readable instructions for identifying active compounds of a microRNA, a method of groupling biological members computed mutations of a microRNA, a method of grouping biological members computed methods of the invention may be applied to the design of sixell for the methods of the invention may be applied to the design of sixell for determining the mode of binding interaction between two or more target colligomeric computers or proximal are useful in drang discovery and target to the ligand as well as their relative affailities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) primer for human CD40 mRNA used to assess expression of CD40 during treatment with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          targeted to the human CD40 gene, designed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RT-PCR; primer; 88; diagnosis; drug discovery; mass spectroscopy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2.3%; Score 23; DB 14; Length 23; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to selecting a target molecule that has an affinity for a ligand that is equal to or greater than a baseline affinity.

Comprises introducing a target molecule into a test mixture of the ligand and a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand. Also included are a method of detecting a ligand-target complex having an affinity as expressed as a dissociation constant of nanomolar-100 millimolar, a method for determining the relative interaction between at least two molecules determining target a ligand, a method of determining the relative proximity of binding sites for a first target molecule and a second target molecule with respect to a ligand, a method of determining the relative orientation of a first target molecule when contentation of a first target molecule to a second target molecule when bound to a ligand, a method for screening the binding shifnity of a target molecule for a ligand, a method for refining the binding of a target molecule for a ligand, a method of favoring an alternate structure
                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass

Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass spectrometer

Example 65; SEQ ID NO 152; 314pp; English.

The invention relates to selecting a target molecule that has an affinity comprises introducing a target molecule into a test mixture of the ligand comprises introducing a target molecule into a test mixture of the ligand and standard target, introducing the test mixture into a mass the ligand comprises introducing a target molecule and the ligand. Also included are a method of detecting a ligand-target complex to many an affinity as expressed as a dissociation constant of nanomolar low millimolar, a method for determining the relative interaction between at least two molecules determining the relative interaction between at least two molecules determining the relative interaction between determining binding interaction (between a first target molecule and a second target molecule on a ligand, a method of determining the relative conferration of a first target molecule on a ligand, a method of determining the binding affinity of a conferration of a first target molecule for a ligand, a method for modulating the binding affinity of a finit target molecule for a ligand, a method of favoring an alternate structure compound secondary structure, a method for refining the binding affinity of a target molecule for a ligand, a method of favoring an alternate structure of an oligomer, a method for identifying a ligand to a target compound secondary structure, a method of determining the relative change in proximity of a first ligand and a second ligand when bound so the first ligand and a second binding sites for a first ligand and a second binding sites for a first binding site for a second ligand when bound to a target substrate and ligand when bound to a target substrate, an nucleotide sequence that corresponds to a portion of the nucleotide sequence that corresponds to a portion of the nucleotide sequence that corresponds to a portion of the nucleotide sequence at least 80% compression of a precursor. Or an early a method of modulating translation in a cell, a method of modulating each of comprises a nucleotide sequ according to a grouping criteria, a method of determining a blur-factor and a method of determining a group of probable mutations for a microRNA. The methods of the invention may be applied to the design of siRNA (short interfering RNA) and antisense oligonucleotides. The method is useful for determining the mode of binding interaction between two or more target molecules to the ligand as well as their relative affinities. The oligomeric compounds are useful in drug discovery and target validation, diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) primer for human CD40 mRNA used to assess expression of CD40 during treatment with antisense oligonucleotides targeted to the human CD40 gene, designed according to the methods of the invention.

/note="Organ: leaf, Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamH1; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastae.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips; double digested using
BamHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
